

Experiment 7

Student Name: Anuj Yadav

UID: 23BIA50011

Branch: BE-AIT-CSE

Section/Group: 23AML_KRG-1

Semester: 5th

Date of Performance: 22 Nov 2025

Subject Name: ADBMS

Subject Code: 23CSP-333

HARD - LEVEL

1. Problem Title: Transactions

2. Problem Description: Design a robust PostgreSQL transaction system for the students table where multiple student records are inserted in a single transaction. If any insert fails due to invalid data, only that insert should be rolled back while preserving the previous successful inserts using savepoints. The system should provide clear messages for both successful and failed insertions, ensuring data integrity and controlled error handling.

3. SQL Commands:

```
DROP TABLE IF EXISTS students;
```

```
CREATE TABLE students (  
  id SERIAL PRIMARY KEY,  
  name VARCHAR(50) UNIQUE,  
  age INT,  
  class INT  
);
```

```
-- EXCEPTION HANDLING
```

```

DO $$
BEGIN TRANSACTION
  -- Start a transaction
  BEGIN
    -- Insert multiple students
    INSERT INTO students(name, age, class) VALUES ('Anisha',16,8);
    INSERT INTO students(name, age, class) VALUES ('Neha',17,8);
    INSERT INTO students(name, age, class) VALUES ('Mayank',19,9);

    -- If all succeed
    RAISE NOTICE ' Transaction Successfully Done';

    EXCEPTION WHEN OTHERS THEN
      -- If any insert fails
      RAISE NOTICE 'Transaction Failed..! Rolling back changes.';
      RAISE; -- this will rollback the entire transaction
    END;
  END;
$$;

SELECT * FROM students;

--VIOLATED SCENARIO
DO $$
BEGIN TRANSACTION
  -- Start a transaction
  BEGIN
    -- Insert multiple students
    INSERT INTO students(name, age, class) VALUES ('Anisha',16,8);
    INSERT INTO students(name, age, class) VALUES
('Mayank',19,9);
    INSERT INTO students(name, age, class) VALUES ('Anisha',17,8); --
ERROR
    INSERT INTO students(name, age, class) VALUES ('Mayank',19,9);

    -- If all succeed
    RAISE NOTICE ' Transaction Successfully Done';

```

EXCEPTION WHEN OTHERS THEN

-- If any insert fails

RAISE NOTICE 'Transaction Failed..! Rolling back changes.';

RAISE; -- this will rollback the entire transaction

END;

END;

\$\$;

4. Output:

Output:

```
DROP TABLE  
CREATE TABLE
```

```
psql:commands.sql:1: NOTICE:  table "students" does not exist, skipping  
psql:commands.sql:34: NOTICE:  Transaction Successfully Done  
psql:commands.sql:34: NOTICE:  Transaction Failed! Rolling back changes.  
psql:commands.sql:34: ERROR:   cannot commit while a subtransaction is active  
CONTEXT:  PL/pgSQL function inline_code_block line 14 at COMMIT
```

9. Learning Outcomes:

- I learned how to create triggers.
- I learned how to perform types of triggers.
